

Finishes: Patterns

Terrain

Lockin

Overview

Terrain translates the topography surrounding a project site into a project-specific perforation pattern for Lockin premium steel locker doors.

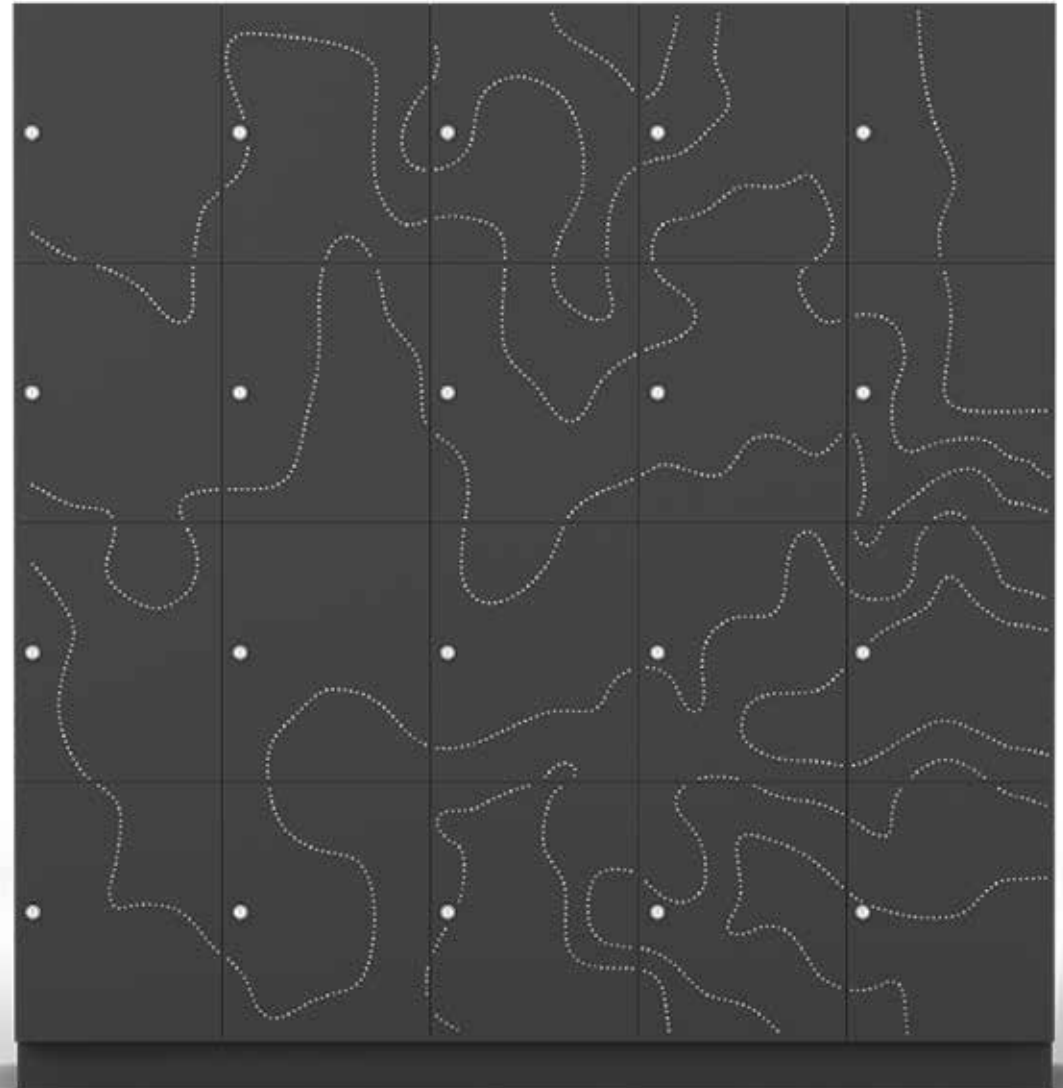

Each pattern is generated from the topography of its project location, creating a subtle connection between the locker installation and the surrounding landscape.

Project application

The mapped area can be expanded or refined to suit different locker configurations while maintaining the integrity of the underlying topography.

Perforation considerations

Locker configuration

The Terrain pattern is developed in response to the nominated locker elevation, including door size, tier configuration and overall bank dimensions.

Pattern scale

The mapped area may be widened, tightened or repositioned to suit the project while retaining the relationship to the original topographic data.

Perforation resolution

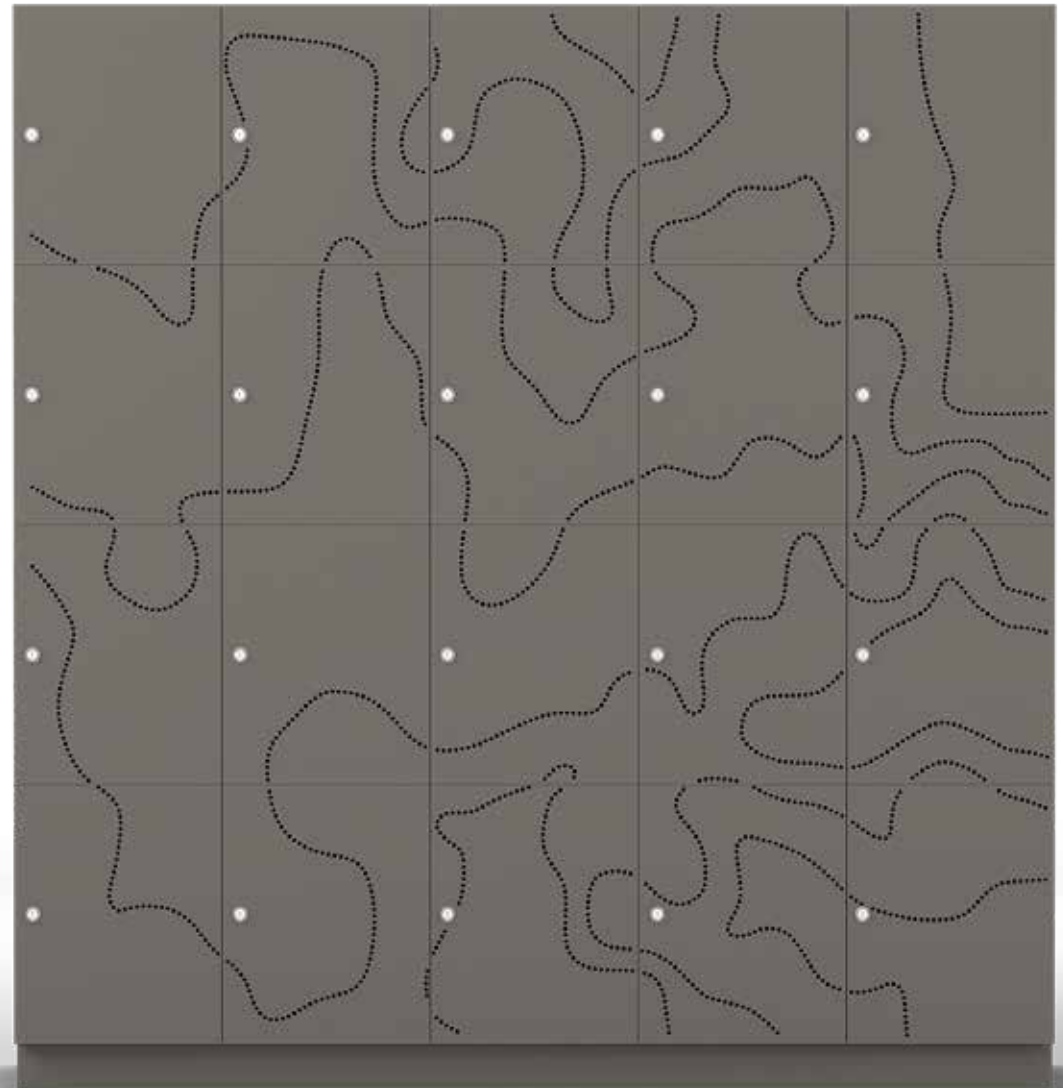

The final pattern is resolved to suit the selected locker configuration and manufacturing requirements. Perforation density and spacing may therefore vary between projects.

Acoustic backing & contrast

EchoPanel can be fitted behind perforated doors to introduce colour contrast and improve acoustic performance.

To specify a Terrain pattern for your project, provide:

Project location with postcode
Indicative locker layouts
Preferred locker configuration
Preferred powdercoat finish

Northcote, Victoria
